

WE ARE HIRING · #02

Senior Backend *Engineer*

Own the data plane of a **multi-tenant visual-intelligence platform** for the construction industry. Ship the API surface, the Postgres schema, and the integrations — while the AI handles the spatial stuff.

— 01

BUILD, DON'T MANAGE

You will be the only backend engineer. Decisions are yours. No 8-deep review chain.

— 02

REAL OWNERSHIP

0.5%–1.0% equity. Hire #2. The architecture is pinned — only ship is left.

— 03

NO THEATER

No panel of 6 people. No whiteboard algorithms. Paid take-home. 2-week close.

COMPENSATION

\$160k–\$200k *base*

EQUITY

0.5%–1.0% *vesting*

TYPE

Full-time, *remote*

Full job description on the pages that follow.

[READ MORE →](#)

Senior Backend Engineer

- Design, build, test, deploy, and operate the backend services that power the platform.
 - Own the data model: PostgreSQL schemas, parameterized SQL, row-level security, migrations.
 - Build REST APIs with idempotency, RFC 7807 error responses, and structured request-id-propagated logging.
 - Implement authentication and authorization: OIDC, SAML SSO, SCIM, MFA, RBAC + ABAC, share-link tokens.
 - Build reliable ingestion pipelines: chunked-resumable uploads, virus scan, transcode, async DAG workflows with backpressure and DLQ.
 - Build and maintain 3rd-party integrations (priority set: Procore, ACC, P6) with OAuth + webhooks + replay.
 - Operate on AWS (EKS, S3, RDS, Lambda, Step Functions, EventBridge, KMS, CloudWatch) using IaC.
 - Mentor the frontend engineer on backend topics during paired sessions.
 - Participate in on-call rotation (every other week) once services are in production.
-

10 · MUST-HAVE REQUIRED QUALIFICATIONS

● MUST-HAVE

6+ years of professional software development experience, with a focus on backend systems.

● MUST-HAVE

Deep proficiency in TypeScript and Node.js in production. You have shipped at least one REST API that handles > 10k RPS or > 1 TB/month of uploads.

● MUST-HAVE

Strong AWS experience: deployed services on EC2/EKS, used S3 directly (not just `aws-sdk`), written IAM policies from scratch, debugged CloudWatch logs.

● MUST-HAVE

Production multi-tenancy experience. You have enforced tenant isolation at every data plane — API, database, cache, search, object storage, and event bus — not just the API.

● MUST-HAVE

Experience with Git, CI/CD, and DevOps practices.

● MUST-HAVE

Bachelor's degree in Computer Science, Computer Engineering, or a related field (or equivalent practical experience).

● MUST-HAVE

Deep PostgreSQL fluency: window functions, query plans, locking, RLS, partitioning, and parameterized SQL.

● MUST-HAVE

Production experience with strict TypeScript (`noUncheckedIndexedAccess`, `exactOptionalPropertyTypes`, or equivalent). You treat `as` as a last resort.

● MUST-HAVE

Strong knowledge of SQL, relational databases, and data modeling.

● MUST-HAVE

Experience developing applications in Linux environments.

11 · NICE-TO-HAVE PREFERRED SKILLS

● NICE-TO-HAVE

Construction, geospatial, or 3D / 360° / point-cloud product experience.

● NICE-TO-HAVE

Kinesis, SQS, EventBridge, or Kafka in production.

● NICE-TO-HAVE

Public APIs, partner-tier SLAs, and webhook delivery with HMAC + replay.

● NICE-TO-HAVE

AWS (EC2, S3, RDS, EKS, Lambda) or other cloud platforms.

● NICE-TO-HAVE

Docker, Kubernetes, Terraform, and Bash scripting.

● NICE-TO-HAVE

TDD discipline and strict test coverage requirements.

● NICE-TO-HAVE

Fastify, Express, or comparable Node.js web frameworks.

● NICE-TO-HAVE

Step Functions, Airflow, or other workflow orchestrators.

● NICE-TO-HAVE

Elixir / Phoenix Channels, or willingness to learn.

● NICE-TO-HAVE

Frontend development with React, Next.js, HTML, and CSS — enough to pair with the frontend engineer.

● NICE-TO-HAVE

Application performance optimization and scalable software design.

WHAT SUCCESS LOOKS LIKE

05 · 90-DAY TARGETS **SUCCESS IN 90 DAYS**

- 200+ tests passing across the workspace.
- Postgres parity for all backend services; production-readiness score $\geq 80\%$.
- A real OIDC provider fully integrated.
- The capture ingestion pipeline shipped end-to-end (upload $\rightarrow$ processing $\rightarrow$ ready $\rightarrow$ realtime push).
- 1 third-party integration in production (round-trip CRUD).
- Zero Sev1 incidents; Sev2 MTTR < 4 h.
